13. (previously presented) A system for converting video standards comprising:

a first input module receiving first analog video signal from a first video source and converting the first analog video signal to a digital video signal, wherein the first input module converts the first analog video signal from a standard of the first video source to a bus standard;

a second input module receiving second analog video signal from a second video source and converting the second analog video signal to a digital video signal, wherein the second input module converts the second analog video signal from a standard of the second video source to the bus standard;

a bus attached to outputs of the first and second input modules;

an input selection and control device (ISC) for selecting at least one of the first and second input modules to drive the bus;

first and second output modules attached to an output of the bus;

a first video device attached to the first output module; and

wherein the first output module converts a digital video signal from the bus standard to a standard of the first video device.

14. (original) The system of claim 13 wherein at least one of the first and second input modules converts a standard of a video signal to match the video standard of the bus.

15. (original) The system of claim 14 wherein a video standard of the first output module is different from a video standard of the second output module.

16. (original) The system of claim 13 and comprising a computer for controlling the ISC.

17. (original) The system of claim 16 and comprising a foot-pedal for controlling the computer.

18. (original) The system of claim 13 wherein at least one of the input modules is a dual-input module having a pair of connectors connected to sources having identical standards.

19. (original) The system of claim 13 wherein at least one of the output modules is a dual-output module having a pair of connectors connected to two video devices having identical video standards.

20. (original) The system of claim 13 and comprising a third output module, wherein the first, second, and third output modules have different video standards.

21. (original) The system of claim 13 and comprising:

a second video device; and

wherein the first video device is attached to the first output module;

wherein the second video device is attached to the second output module;

wherein the first and second video devices have different standards.

22. (previously presented) A system for converting video standards comprising:

a first input module receiving first analog video signal from a first video source and converting the first analog video signal to a digital video signal, wherein the first input module converts the first analog video signal from a standard of the first video source to a bus standard;

a second input module receiving second analog video signal from a second video source and converting the second analog video signal to a digital video signal, wherein the second input module converts the second analog video signal from a standard of the second video source to the bus standard;

a bus attached to outputs of the first and second input modules;

an input selection and control device (ISC) for selecting at least one of the first and second input modules to drive the bus;

a computer for controlling the ISC;

first and second output modules attached to an output of the bus;

a first video device attached to the first output module;

a second video device attached to the second output module; and

wherein the first output module converts a standard of a video signal from the bus standard to a standard of the first video device;

wherein a video standard of the first output module is different from a video standard of the second output module;

wherein the first and second video devices have different standards.

23. (previously presented) A system for displaying images from two sources, the system comprising:

a first input module converting a first analog video signal to a first digital video signal, wherein the first input module converts the first analog video signal from a standard of a first video source to a bus standard;

a second input module converting a second analog video signal to a second digital video signal, wherein the second input module converts the second analog video signal from a standard of a second video source to the bus standard;

a bus attached to outputs of the first and second input modules;

a first output module attached to an output of the bus;

a second output module attached to the output of the bus;

a first display device attached to one of the first and second output modules; and

wherein the bus drives the first output module to convert the first and second digital video signals to respective first and second analog display signals containing images for reception by the first display device;

wherein at least a portion of each image from the first and second analog display signals is displayed on the first display device.

24. (original) The system of claim 23 wherein images from one of the first and second analog display signals are displayed in a quadrant of the first display device.

25. (original) The system of claim 23 wherein padding is positioned adjacent at least a portion of an image from the first or second analog video display signals.

26. (original) The system of claim 23 and comprising an ISC for selecting one of the first and second video signals to be a window image and the other video signal to be the background image.

27. (original) The system of claim 23 and comprising:
a third input module attached to the bus.

28. (original) The system of claim 23 and comprising an ISC for controlling positions at which the images from the first and second analog video display signals are displayed on the first display device.

29. (original) The system of claim 23 and comprising:

a second display device; and

wherein the first display device is attached to the first output module;

wherein the second display device is attached to the second output module;

wherein the first and second display devices have different standards.

30. (previously presented) A system for displaying images from two sources, the system comprising:

a first input module converting a first analog video signal to a first digital video signal, wherein the first input module converts the first analog video signal from a standard of a first video source to a bus standard;

a second input module converts a second analog video signal to a second digital video signal, wherein the second input module converts the second analog video signal from a standard of a second video source to the bus standard;

a bus attached to outputs of the first and second input modules;

a first output module attached to an output of the bus;

a second output module attached to an output of the bus;

a first display device attached to the first output module;

a second display device attached to the second output module; and

wherein the first output module converts the first and second digital video signals to respective first and second analog display signals containing images for reception by the first display device;

wherein at least a portion of each image from the first and second analog display signals is displayed on the first display device; and

wherein the first and second display devices have different standards.

31. (original) The system of claim 30 and comprising an ISC for selecting one of the first and second analog video signals to supply window images and the other analog video signal to supply background images.

32. (previously presented) A method for converting a plurality of video sources having a plurality of different standards, the method comprising the steps of:

providing a video standards converter (VSC) comprising:

a first input module;

a second input module;

a bus attached to outputs of the first and second input modules;

a first output module attached to an output of the bus;

a second output module attached to an output of the bus;

employing one of the first and second input modules to convert a video signal from analog to digital, wherein one of the first and second input modules converts a standard of the video signal to a bus standard;

employing the bus to drive one of the first and second output modules to convert the video signal from digital to analog;

selecting one of the first and second input modules to place a video signal onto the bus; and

positioning the video signal as the signal is placed on the bus.

33. (original) The method of claim 32 and comprising the step of providing a third output module attached to the bus.

34. (original) The method of claim 32 and comprising the steps of:

providing a display device attached to one of the output modules; and

displaying images of the video signal on the display device attached to the output module.

40. (previously presented) The system of claim 13 wherein the bus standard includes an aspect ratio of a video image.

41. (previously presented) The system of claim 22 wherein the bus standard includes an aspect ratio of a video image.

42. (previously presented) The system of claim 23 wherein the bus standard includes an aspect ratio of a video image.

43. (previously presented) The system of claim 30 wherein the bus standard includes an aspect ratio of a video image.
